

### **IN THE CLAIMS**

The following is a complete listing of revised claims with a status identifier in parenthesis. Claims 7, 9, 10, 15, 16 and 20 have been cancelled without prejudice to, or disclaimer of, the subject matter of these claims. Much of the subject matter of these cancelled claims has been placed into an independent claim.

#### **LISTING OF CLAIMS**

1. (Currently Amended) A method for transmitting information in a communication channel of a wireless communication system, the method comprising:  
dividing the communication channel into a plurality of time slots of equal duration;  
sub-dividing, on other than a time division basis, each of the plurality of time slots to comprise two or more sub-slots, and  
~~variably allocating a number of contiguous sub-slots allocated to at least one of the time slots, within a transmission in the channel, from a number of sub-slots allocated to at least one other time slot within the transmission;~~  
transmitting two or more contiguous sub-slots to form a separate transmission; and  
transmitting a separate control channel for each separate transmission,  
wherein the duration of the separate control channel is dependent upon the number of transmitted sub-slots.
2. (Currently Amended) The method according to claim 1, wherein each of the two or more contiguous sub-slots ~~within a particular time slot~~ is separately transmitted according to a code division multiple access scheme.
3. (Original) The method according to claim 2 wherein, in any one of the plurality of time slots, each of a plurality of transmissions are separately coded and carried in a separate sub-slot simultaneously in such time slot.
4. (Original) The method according to claim 3 wherein each of the plurality of transmissions correspond to a separate user of the wireless communication system.

5. (Original) The method according to claim 3, wherein each of the plurality of transmissions correspond to separate transmissions of a single user of the wireless communication system.

6. (Original) The method according to claim 1, wherein each of the two or more sub-slots within a particular time slot corresponds to a different frequency according to a frequency division multiple access scheme.

7. (Cancelled)

8. (Original) The method according to claim 1, wherein the communication channel comprises time slots each having a duration of 1.25 milliseconds and wherein each of the time slots comprises at least two sub-slots.

9. (Cancelled)

10. (Cancelled)

11. (Original) The method according to claim 1 9, wherein the communication channel is a forward packet data channel (F-PDCH), wherein information is transmitted as encoder packets in the forward packet data channel (F-PDCH), and wherein the separate control channel is a forward secondary packet data control channel (SPDCCH).

12. (Original) The method according to claim 11, wherein the forward secondary packet data control channel (SPDCCH) includes:

a sub-slot start field for identifying a sub-slot within a time slot in which a particular transmission starts; and

a sub-slot count field for identifying the total number of sub-slots that carry the particular transmission.

13. (Original) The method according to claim 11, wherein a plurality of forward secondary packet data control channels (SPDCCH) correspond to a plurality of simultaneous transmissions on the forward packet data channel (F-PDCH), and wherein each of the plurality of secondary packet data control channels (SPDCCH) identifies a sub-slot start position within a time slot in which a particular transmission starts.

14. (Currently Amended) A method for transmitting information in a communication channel of a wireless communication system, the method comprising:

dividing the communication channel into a plurality of time slots of equal duration according to a time division multiple access scheme; and

sub-dividing each of the plurality of time slots to comprise two or more sub-slots according to a code division multiple access scheme;

transmitting two or more contiguous sub-slots to form a separate transmission; and

transmitting a separate control channel for each separate transmission,

wherein the duration of the separate control channel is dependent upon the number of transmitted sub-slots

~~variably allocating a number of contiguous sub-slots allocated to at least one of the time slots, within a transmission in the channel, from a number of sub-slots allocated to at least one other time slot within the transmission.~~

15. (Cancelled)

16. (Cancelled)

17. (Previously Presented) The method according to claim 1, wherein bandwidth in the communication channel is allocated on a fractional basis to carry a plurality of transmissions using a combination of a variable number of contiguous sub-slots and a variable number of contiguous time slots.

18. (Previously Presented) The method according to claim 1, wherein transmissions within the communication channel include two or more transmissions selected

from the group consisting of new transmissions, retransmissions, acknowledgements (ACKs), negative acknowledgements (NACKs), and multi-level ACK/NACK message corresponds to multi-level ACK/NACK messages.

19. (Previously Presented) The method according to claim 18, wherein a multi-level ACK/NACK message corresponds to multiple transmissions that end within the same time slot.

20. (Cancelled)
